[R Studio For Mac 30 Build 1452 Serial](#)

The image shows an IDE window with two tabs: `myClass1.java` and `myClass2.java`. The `myClass1.java` editor contains the following code:

```

1  /*
2  * To change this license header, choose License Headers in Project Properties.
3  * To change this template file, choose Tools | Templates
4  * and open the template in the editor.
5  */
6  package javaapplication9;
7
8  /**
9   *
10  * @author akkgupta
11  */
12  public class myClass1 {
13
14  public void meth1 () {
15      new myClass2().
16  }
17  }
18

```

A tooltip is displayed over the `new myClass2().` line, listing the following methods:

<input type="radio"/>	<code>equals(Object obj)</code>	<code>boolean</code>
<input type="radio"/>	<code>getClass()</code>	<code>Class<?></code>
<input type="radio"/>	<code>hashCode()</code>	<code>int</code>
<input type="radio"/>	<code>meth12()</code>	<code>void</code>
<input type="radio"/>	<code>notify()</code>	<code>void</code>
<input type="radio"/>	<code>notifyAll()</code>	<code>void</code>
<input type="radio"/>	<code>toString()</code>	<code>String</code>
<input type="radio"/>	<code>wait()</code>	<code>void</code>
<input type="radio"/>	<code>wait(long timeoutMillis)</code>	<code>void</code>
<input type="radio"/>	<code>wait(long timeoutMillis, int nanos)</code>	<code>void</code>

Below the tooltip, a separate window displays the documentation for `java.lang.Object.equals(Object obj)`:

java.lang.Object
`public boolean equals(Object obj)`

Indicates whether some other object is "equal to" this one.

The `equals` method implements an equivalence relation on non-null object references:

- It is *reflexive*: for any non-null reference value `x`, `x.equals(x)` should return `true`.
- It is *symmetric*: for any non-null reference values `x` and `y`, `x.equals(y)` should return `true` if and only if `y.equals(x)` returns `true`.
- It is *transitive*: for any non-null reference values `x`, `y`, and `z`, if `x.equals(y)` returns `true` and `y.equals(z)` returns `true`, then `x.equals(z)` should return `true`.
- It is *consistent*: for any non-null reference values `x` and `y`, multiple invocations of `x.equals(y)` consistently return `true` or consistently return `false`.
